Homework 4

Instructions

- This homework focuses on understanding and applying CoCoOp for CLIP prompt tuning. It consists of **four questions** designed to assess both theoretical understanding and practical application.
- Please organize your answers and results for the questions below and submit this jupyter notebook as **a .pdf file**.
- **Deadline: 11/26 (Sat) 23:59**

Preparation

- Run the code below before proceeding with the homework (Q1, Q2).
- If an error occurs, click 'Run Session Again' and then restart the runtime from the beginning.

Q1. Understanding and implementing CoCoOp

- We have learned how to define CoOp in Lab Session 4.
- The main difference between CoOp and CoCoOp is **meta network** to extract image tokens that is added to the text prompt.
- Based on the CoOp code given in Lab Session 4, fill-in-the-blank exercise to test your understanding of critical parts of the CoCoOp.

```
import torch.nn as nn

class CoCoOpPromptLearner(nn.Module):
    def __init__(self, cfg, classnames, clip_model):
        super().__init__()

Q2. Trainining CoCoOp

In this task, you will train CoCoOp on the EuroSAT dataset. If your implementation of CoCoOp in Question 1 is correct, the following code should execute without errors. Please submit the execution file so we can evaluate whether your code runs without any issues.

```
# Train on the Base Classes Train split and evaluate accuracy on the Base Classes Test split.
args.trainer = "CoCoOp"
args.train_batch_size = 16
args.epoch = 100
args.output_dir = "outputs/cocoop"

args.subsample_classes = "base"
args.eval_only = False
cocoop_base_acc = main(args)
```

```
* error: 11.0%
* macro_f1: 89.1%
Elapsed: 0:06:49
```

```
# Accuracy on the New Classes.
args.model_dir = "outputs/cocoop"
args.output_dir = "outputs/cocoop/new_classes"
args.subsample_classes = "new"
args.load_epoch = 100
args.eval_only = True
coop_novel_acc = main(args)
```

```

Q3. Analyzing the results of CoCoOp

Compare the results of CoCoOp with those of CoOp that we trained in Lab Session 4. Discuss possible reasons for the performance differences observed between CoCoOp and CoOp.

> 실험 결과, CoOp은 Base Class와 New Class 모두에서 CoCoOp보다 높은 성능을 기록했습니다.

> Base Class:
>
> CoOp: Accuracy = 91.4%, Macro F1 = 91.5%
>
> CoCoOp: Accuracy = 89.0%, Macro F1 = 89.1%

> New Class:
>
> CoOp: Accuracy = 51.5%, Macro F1 = 45.6%
>
> CoCoOp: Accuracy = 47.6%, Macro F1 = 47.2%

CoOp이 CoCoOp보다 더 나은 성능을 보인 이유는 다음과 같이 해석할 수 있습니다:

CoOp의 정적 컨텍스트가 데이터셋에 유리했을 가능성:

CoOp은 정적 컨텍스트 벡터를 사용하기 때문에, Base Class와 같은 학습 데이터에 더 적합하게 작동했을 가능성이 있습니다. EuroSAT 데이터셋은 상대적으로 균일하고 간단한 클래스 구조를 가지므로, 정적 컨텍스트가 데이터 분포를 충분히 모델링할 수 있었을 것입니다.

CoCoOp의 동적 컨텍스트 학습의 일반화 부족:

CoCoOp은 동적 컨텍스트 학습을 통해 데이터의 미세한 차이를 학습하려 하지만, 이 과정에서 Base Class에서 약간의 성능 손실이 발생한 것으로 보입니다. 특히 New Class에서 성능이 CoOp보다 낮은 이유는 동적 컨텍스트가 New Class의 분포를 충분히 일반화하지 못했기 때문일 수 있습니다.

하이퍼파라미터 조정 부족:

CoCoOp은 더 많은 하이퍼파라미터(예: 컨텍스트 토큰 수, 메타 네트워크 크기 등)가 필요합니다. 적절히 조정되지 않았다면 성능 저하로 이어질 수 있습니다.

모델 복잡성 증가로 인한 과적합 가능성:

CoCoOp의 복잡한 구조(메타 네트워크 및 동적 학습 컨텍스트)가 Base Class에 과적합되었을 가능성이 있습니다. 이로 인해 New Class의 일반화 성능이 저하되었을 수 있습니다.
